Vertical and horizontal dimensions in the fourfold logic

Integrating Polar Dynamics in the World Soul Model

Author: Martin Euser
Date: December 2025

Summary

This paper explores how vertical (individual consciousness/spiritual) and horizontal (social/relational) dimensions interact within the Fourfold Logic and World Soul model. The analysis demonstrates that these two axes operate simultaneously at each of four organizational layers—physical/organism, emotional/soul, mental-cognitive, and spiritual—providing a framework that extends beyond Wilber's Integral Theory by incorporating explicit polarity (upper/nether poles), directionality (arc of descent and ascent), and dynamic transformation of substance and consciousness.

The vertical dimension represents depth, hierarchy, and developmental movement from material embodiment toward spiritual unification. The horizontal dimension represents the field of connections, relationships, and exchanges at each layer—how organisms interact with their environment (umwelt), society, and collective consciousness. These dimensions intersect at boundary zones or membranes that selectively filter influences, enabling both resilience and evolutionary adaptation.

Key insights include: (1) the membrane as mediator between external horizontal influences and internal vertical integration; (2) reciprocal causality between individual transformation and societal evolution; (3) the necessity of cyclical movement between solitary vertical ascent and collective horizontal engagement to avoid developmental stagnation; and (4) individuation as the harmonious alignment of all layers, enabling wholeness and conscious participation in both matter and spirit.

Drawing from Neoplatonic philosophy, Vedic wisdom, theosophy, cybernetics (Viable System Model), and systems science, the paper provides examples from psychology, ecology, and spiritual traditions, showing universal organizational principles across biological, psychological, and spiritual domains.

1. Introduction

Each focus in the World Soul model has an upper pole and a nether pole. The upper pole connects to the consciousness side (spiritual, directed nature), while the nether pole is the basis for manifestation and participates in the field of operation (material, substantial pole of the

psycho-magnetic force). This polarity can be understood as a consciousness pole and a material/substance pole—the former manifesting as states of consciousness, the latter as formed substance.

In the World Soul model, the kama-buddhi phase (described in The World Soul and its Foci, Part Two) represents a spiritual phase in the development of the Kama (desire) principle. This vertical dimension is present as the right side of the V-shaped arc of development, representing stages of spiritualization and conscious ascent. The left side represents incarnation into matter, associated with the substantive side of processes. The left side also has consciousness aspects, though less pronounced than the right side. Similarly, the right side has a substantive aspect, but stages on this side are more mental-spiritual (especially stage 6 and above).

This paper examines how the vertical (consciousness/spiritual) and horizontal (social/relational) dimensions interact within the Fourfold Logic, comparing this framework to Wilber's Integral Theory and other developmental models. The analysis shows that these dimensions are not separate but dynamically interwoven at each organizational layer, with membranes mediating between external influences and internal integration across biological, psychological, and spiritual domains.

2. World soul sevenfold arc versus Ken Wilber's quadrants

Ken Wilber's Integral Theory divides reality into four quadrants:

- Upper Left (UL): Individual-Interior (consciousness, felt experience)
- Upper Right (UR): Individual-Exterior (behaviors, material body)
- Lower Left (LL): Collective-Interior (culture, shared meaning)
- Lower Right (LR): Collective-Exterior (systems, environments)

  See Wilber (2005) for a canonical introduction to the AQAL framework
  (all quadrants, all levels, lines, states, and types).

These quadrants are “flat” in that they exist at every developmental level or stage but do not inherently encode a directionality of spiritual ascent or material descent. Development occurs within each quadrant across stages, but the quadrant structure itself does not articulate a polarity of incursion into matter versus return to spirit.

3. World Soul Model: Polarity and Movement

The World Soul model incorporates:

- Arc of development: left side = descent/incarnation; right side = ascent/spiritualization.

- Each stage/focus: contains upper (consciousness/spiritual) and nether (manifest/material/substantial) poles.
- Kama-Buddhi phase: exemplifies spiritualization of desire/will—explicit vertical transformation within a principle. This applies to humans in the current cycle of evolution. Animals will reach this phase in a later cycle.

Every stage encodes both consciousness and substance as polarities, with dynamic shifts in emphasis between the arc's left and right sides. The rightward movement spiritualizes the very basis of substantiation itself.

4. Key Differences

Flatness of Wilber's Quadrants:

- The quadrants are primarily modalities (interior/exterior, individual/collective), not vertical movements or polar arcs.
- They excel at mapping perspectives but cannot show the ontological drama of descent and ascent or the transformation of substance and consciousness.

Polarity and Movement in the sevenfold Arc Model:

- The arc has inherent direction (incarnation to spiritualization).
- Each stage includes an active dialectic between upper and lower poles.
- The quadrants cannot depict this drama without an explicit vertical, polar, or teleological axis overlay.

Possible Mapping:

- The upper pole aligns roughly with Wilber's Upper Left (interior/consciousness), but its energy and prominence oscillate rather than remaining static.
- The nether pole resonates with Upper Right (substantial/material), but substance is a vessel for ascent and transformation, not a static base.
- The field of operation relates to Wilber's Lower Right (systems, collective processes), but mediates between individual and cosmic rather than merely collective exterior.

5. The Missing Vertical/Pole Dynamic in Wilber

Wilber's later work sometimes hints at vertical “altitude” (stages), but the quadrants themselves do not encode the deep vertical and polar dialectics found in esoteric or theosophical systems. In the World Soul

arc, verticality is essential: every phase and focus can be read “up” (spiritualization/return) or “down” (incarnation/descent), and every stage is alive with tension between conscious ascent and substantial manifestation.

The vertical, polar, and staged richness of the World Soul arc thus exceeds Wilber's flat quadrants. The explicit dialectical movement between upper (consciousness) and nether (substance/manifestation) poles—especially as it shifts across the arc—provides a missing dynamic for evolutionary and spiritual depth.

6. Horizontal and vertical dimensions across layers

a. Layer Two: Umwelt and External Relations

Layer two addresses interactions with the umwelt (milieu)—external relations with the surrounding world. This horizontal dimension represents:

- How an organism (cell, person, system) is embedded in and interacts with its local environment.
- The network of connections, exchanges, and influences (nutrients, signals, relationships, cultural stimuli).

Examples:

- For cells: molecular exchanges, symbiosis, signal transduction.
- For individuals: social relationships, cultural context, societal norms.
- For psyche: collective moods and archetypes affecting the individual.

b. Layer Three: Membrane and Core Mediation

Layer three involves the core of the personality, cell, or organism. A membrane mediates between outside and inside, filtering influences. This vertical dimension represents:

- Depth—the core of identity or essential functioning.
- The axis of transformation: growth, integration, internalization of influences leading to self-organization, individuation, or spiritual ascent.
- Selective permeability: filtering, transforming, and transmuting outer influences as they pass inward.

Examples:

- Cell membrane: regulates entry, maintains homeostasis, communicates with nucleus.
- Personality: filters experiences, preserves autonomy while remaining open to transformation.
- Spiritual: discernment (inner gate), transformation of mundane into sacred meaning.

7. Integration of Layers

The real work of transformation lies at the interface where horizontal exchanges with the umwelt are selectively filtered and used for vertical ascent by the organism's core:

- Horizontal (Layer Two): formalizes what is exchanged with the world—relational, contextual, collective dimension.
- Vertical (Layer Three): mediates how exchanges are assimilated, transformed, and used for development—integrative, internal, transcendent dimension.
- The membrane determines which influences are admitted, how they are processed, and whether they catalyze further development.

8. Relating to the Arc

- Left (substantive side of the arc): more porous membrane, stronger influence from outer umwelt shaping development—horizontal predominates.
- Right (spiritual side of the arc): more selective membrane, inner core directs integration toward higher consciousness—vertical predominates.

At different phases on the arc, horizontal and vertical are dynamically balanced, modulated by the state of the membrane or boundary.

9. Mapping fourfold layers to vertical and horizontal dimensions

The four layers can be mapped as: physical/organism, emotional/soul, mental-cognitive, and spiritual. Both vertical and horizontal dimensions

manifest at each layer.

Vertical Dimension (Ascent, Integration, Deepening)

The vertical dimension represents depth, hierarchy, and developmental movement from “lowest” (physical/material) toward “highest” (spiritual/unitive):

- Physical/Organism: foundation, embodiment, biological structure (the “nether pole” of manifestation).
- Emotional/Soul: liveliness, affectivity, sense of identity transcending mere materiality.
- Mental-Cognitive: reflection, self-awareness, abstraction, sense-making.
- Spiritual: unitive vision, transpersonal consciousness, highest values (the “upper pole” of consciousness).

Vertical movement means integration or spiritualization of lower aspects by higher, or “return” from dense/material forms to subtle/unitive consciousness.

Horizontal Dimension (Relational, Contextual, Networked)

The horizontal dimension represents the field of connections, relationships, and exchanges at each layer:

- Physical/Organism: material environment, ecological networks, bodily interactions.
- Emotional/Soul: social relationships, group moods, shared affects.
- Mental-Cognitive: language, communication, education, shared knowledge systems.
- Spiritual: participatory rituals, collective meaning, shared cosmologies or ethical systems.

Horizontal movement concerns breadth of interconnection, social participation, and integration into milieu or context.

Summary Table

- Physical/Organism: vertically, bodily discipline, health, self-mastery; horizontally, ecological exchanges and physical relationships.
- Emotional/Soul: vertically, individuation and emotional integration; horizontally, group resonance, empathy, social belonging.
- Mental-Cognitive: vertically, self-reflection, ascent of understanding, inner dialogue; horizontally, knowledge exchange, discourse, culture.

- Spiritual: vertically, mystical union and transcendent integration; horizontally, ritual, shared values, and collective spiritual praxis.

The vertical and horizontal are not in opposition but in creative tension at each layer. The membrane (boundary/mediator) regulates the transaction between individual (vertical) growth and collective (horizontal) context across the arc of evolution and involution.

10. Cross-tradition synthesis

Drawing from Wilber's Integral Theory, Cybernetics (Viable System Model), Neoplatonism, and Theosophical traditions, the four layers can also be cross-mapped:

Body/Nature/Material:

- Vertical: somatic awakening, purification, personal health discipline.
- Horizontal: biological networks, ecological participation, economic exchange.
- Integral/Wilber: mostly LR (behavior/systems) in its exterior aspect; embodied UL in its interior aspect.
- Cybernetic/Systemic: System 1 (operations, metabolic exchange).
- Neoplatonic: Soma/body (hyle) as vehicle of ascent.
- Theosophical: physical body and etheric (linga sharira).

Soul/Psyche/Energy:

- Vertical: emotional individuation, imaginative ascent, subtle perception.
- Horizontal: empathy, group resonance, psychic fields, social drama, emotional contagion.
- Integral: LL (culture/we).
- Cybernetic: coordination and communication channels.
- Neoplatonic: psyche (soul), anima.
- Theosophical: astral body, kama-manas.

Mind/Reason:

- Vertical: cognitive ascent, dialectic, self-reflective thought, moral reasoning.
- Horizontal: collective reasoning, science, education, institutions, language use.

- Integral: primarily UL (intentional/individual).
- Cybernetic: Systems 2–3 (coordination, control) in their reflective role.
- Neoplatonic: nous/mind (intellective soul).
- Theosophical: manas (higher and lower) with aspects of the buddhi (discrimination, carrier of light of atman)

Spirit/Self/Transcendent:

- Vertical: unitive gnosis, mystical union (henosis), realization of the One or highest Self.
- Horizontal: religious community, shared mystical ritual, group enlightenment, mythic meaning.
- Integral: transpersonal aspects of UL and the transpersonal “self” line.
- Cybernetic/Systemic: System 5 or meta-system (policy, identity).
- Neoplatonic: the One, the monad, intellect in its highest sense.
- Theosophical: atma-buddhi, monad.

This synthesis articulates both the depth of individual realization and the breadth of collective praxis and participation at each ontological layer, bridging consciousness evolution (vertical) with networked, cybernetic, and social interbeing (horizontal).

11. Dynamic interaction: individual and collective development

Reciprocal Causality and Feedback Loops

Individual transformation (mind/spirit: vertical) affects society (horizontal) by raising collective awareness, ethical standards, and creativity. As society integrates these changes, new opportunities for both individual and collective upward movement emerge, though this is usually a gradual process.

In cybernetics, this resembles a feedback loop where the individual provides innovation (variety injection), and the social field provides amplification and selection. In the Viable System Model (VSM), individual insight (System 4: future/innovation) may eventually become collective wisdom or policy (System 5: identity/policy).

Developmental Pathways

- Solitary Path: direct, rapid progress in vertical development (deep meditation, gnosis), but with risk of homeostasis or looping (getting stuck at a plateau due to insufficient horizontal crossing and

novelty).

- Collective Path: slower, but producing transformation that is deeply integrated, stabilizing both society and individual. The risk is dilution or stagnation without vertical stimulus.

12. Cyclical Movement

To avoid getting stuck in a rut (solitary) or diluted (collective), the model suggests cyclical movement:

1. Ascent (vertical) → integration (horizontal).
2. Contribution/teaching → social absorption → emergence of new challenges → return to solitary refinement.

This blends vertical leaps with horizontal diffusion, making both personal and societal development robust, resilient, and evolutionarily fruitful.

13. Philosophical Anchors

- Neoplatonic/Plotinian: mystical ascent is perfected when the sage "returns" to harmonize the polis, mediating between divine and collective.
- Wilber/Integral: healthy development requires both "waking up" (vertical ascent) and "growing up / cleaning up / showing up" (horizontal/collective integration).
- VSM/Systems: viably adaptive systems alternate between amplifying internal innovation and stabilizing through external integration.

14. Example flow: emotional/soul layer

Scenario: A person engages in group dialogue about climate grief, receiving emotional input from their social environment.

Step-by-step flow:

1. Horizontal input: The person is exposed to group emotion—stories, waves of sadness, hope, and anxiety about ecological crisis (horizontal/collective context).
2. Membrane/mediation: Their psychological membrane filters these influences—some feelings resonate and penetrate the self, others are blocked or transformed based on boundaries, values, and readiness.
3. Vertical integration (ascent): The emotions that pass the membrane

are integrated—triggering inner growth, self-reflection, emotional maturation. The person deepens empathy, expands resilience, and finds new meaning or purpose.

4. Dynamic feedback: Processed and refined emotions are shared back to the group—enabling circular learning and strengthening collective emotional wisdom.

The same structure applies to other layers:

- Physical/Organism: nutrients or toxins from environment filtered by cell membrane, processed for health or ejected.
- Mental-Cognitive: information, cultural narratives, scientific ideas filtered by the mind; the assimilated part contributes to deeper understanding.
- Spiritual: ritual experience, shared values, mystical symbols received, filtered by personal discernment, transformed into spiritual growth.

15. Individuation as wholeness

The Integration Process

Before individuation, each layer (physical, emotional, mental, spiritual) may function relatively independently, with fragmented or unaligned responses. Bodily habits, emotions, thoughts, and ideals may conflict, creating dissonance across layers.

Through individuation:

- The membranes between layers become permeable and harmoniously selective, allowing information and energy to flow while preserving healthy boundaries.
- The vertical axis (depth/ascent) aligns: instinct (body), affect (soul), insight (mind), and meaning (spirit) form a continuous developmental path.
- The horizontal axis (context/relationship) integrates: the individual becomes grounded, emotionally resonant, intellectually lucid, and spiritually connected within community and world.

At wholeness (individuation achieved):

- There is a felt sense of centeredness—the core Self is radiant and present in every layer.
- Actions, feelings, thoughts, and aspirations are congruent and mutually reinforcing.
- The individual can receive and transmit across every layer, acting as

a bridge between matter and spirit, self and society.

16. Visual Representation

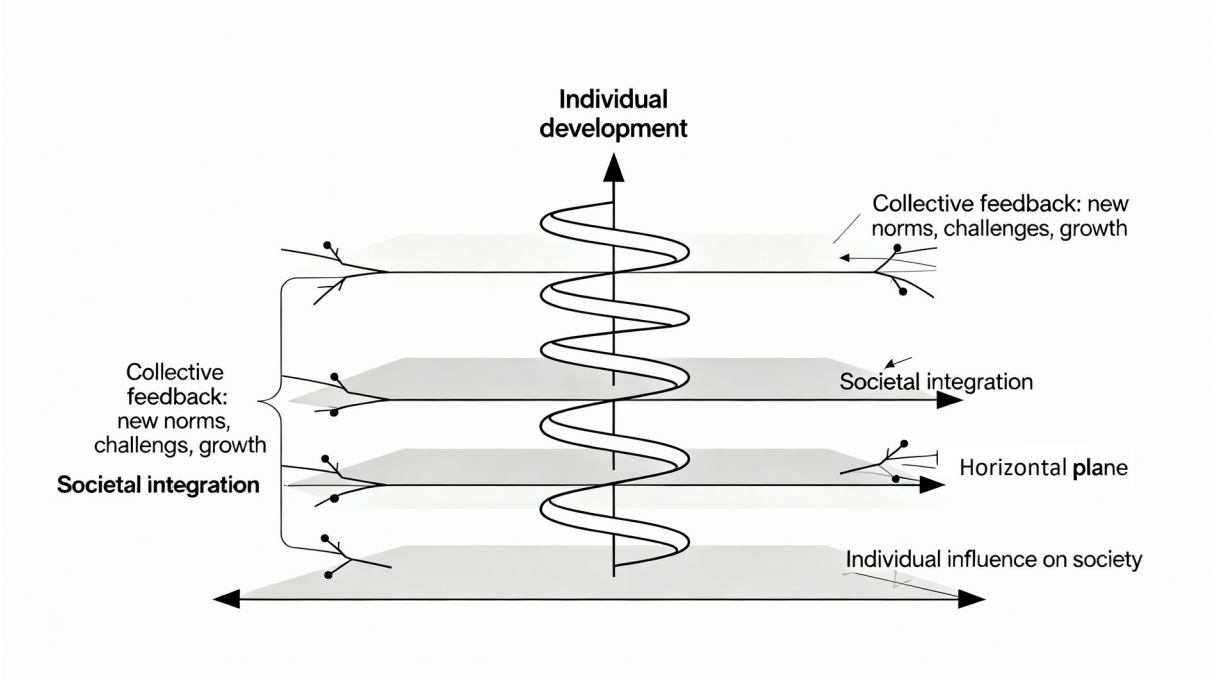

Fig. 1: Individual development and societal interaction/integration

The individuation process can be portrayed as a spiral through the four layers (physical outermost, then emotional/mental and spiritual), with vertical (ascent/depth) and horizontal (relationship/context) planes.

17. AQAL – VSM – World Soul mapping

In VSM terms, the individual is taken as the system-in-focus (an S1 subsystem), while “society” functions as the supersystem in which the individual is embedded. This must be clearly indicated in the mapping of Wilber's AQAL quadrants onto the World Soul/Fourfold Logic model.

The AQAL quadrants, VSM mapping, and World Soul mapping can be summarized as follows:

AQAL UL (I, interior-individual)

- VSM: Operation/System 1 at the level of the individual as experiential system. The system 1 as a *subsystem* of the collective humanity or social supersystem. There are as many system 1's as there are individuals.

- World Soul/Fourfold Logic: flow of experience across the four layers (Purpose → Norms → Planning → Execution) within the individual, i.e., the subjective interior.

AQAL UR (It, exterior-individual)

- VSM: Operation/System 1 (as a *subsystem* of the collective humanity or social supersystem) in its measurable output and physiology.
- World Soul/Fourfold Logic: mainly Layer 4 (Execution) and its feedback to Norms, i.e., the visible body and behavior of the individual.

AQAL LL (We, interior-collective)

- VSM: part of the metasystem of the social supersystem (especially S5 identity/policy and S2 coordination of interactional norms).
- World Soul/Fourfold Logic: Layer 2 (Norms) and the deeper cultural core at Layer 1 (Purpose) on supersystem level—the domain of shared meanings, culture, and values.

AQAL LR (Its, exterior-collective)

- VSM: the social supersystem as a whole—metasystem (S2–S5) plus aggregated S1 operations at societal level.
- World Soul/Fourfold Logic: Layers 3–4 (Planning/Execution) on societal level, including institutions, infrastructures, and ecosystems, with “Saturn” symbolizing structural boundaries and audit.

Important nuance:

- UL and UR refer to the individual (system-in-focus, S1) as a

subsystem of the collective.

- LL and LR refer to the *supersystem* in which that individual is embedded, not merely to “the individual doing social things”.

Individual–supersystem interfaces

The four individual layers connect to corresponding supersystem layers through specific interfaces or membranes. Each interface expresses how bottom-up influences from the individual can reshape the supersystem.

(1) Individual Layer 4: Body/Execution

- Interface (membrane): Skin and physical boundary.
- Collective layer influenced: Collective L4 (Infrastructure/Ecosystem).
- Mechanism of influence: The output of individual action (production, consumption, pollution, sustainable practice) modifies the physical environment and infrastructure of the collective. This affects the interobjective LR-field (systems, infrastructures, ecosystems).

(2) Individual Layer 3: Mind/Planning

- Interface (membrane): Brain–mind filter.
- Collective layer influenced: Collective L3 (Governance/Strategy).
- Mechanism of influence: Innovation and discrepancies. Individual intellectual achievements, inventions, and strategies force collective management to develop or adapt new rules, technologies, and economic structures.

(3) Individual Layer 2: Soul/Psyche

- Interface (membrane): Psychological membrane.
- Collective layer influenced: Collective L2 (Culture/Norms).
- Mechanism of influence: Social and ethical change. Individual behavior that deviates from the norm, or strong shared emotional resonance (for example protest, mass adoption of new values), redefines intersubjective norms and the culture of the we-space (LL quadrant).

(4) Individual Layer 1: Spirit/Self

- Interface (membrane): Auric field or spiritual radiance.
- Collective layer influenced: Collective L1 (Archetypal Vision, Purpose).
- Mechanism of influence: Revelation and new paradigms. When an

individual realizes a deep, unique spiritual truth (a “vision”) and radiates it, this can introduce a new fundamental purpose or meaning that the collective consciousness eventually adopts. This is the source of the highest evolution of the supersystem.

18. The role of the individual as evolution engine

The bottom-up causality from the individual S1-subsystem is essential because it is the engine for evolution and correction of the greater whole.

Three key channels can be summarized in arrow form:

1. Correction (L4 -> L3):
   When individual L4 execution (for example disastrous pollution) has undesired consequences, feedback is provided to collective L3 Governance to correct strategy and regulation.
2. Innovation (L3 -> L2):
   Individual strategic breakthroughs at L3 create new possibilities that put pressure on old cultural norms (L2) to change.
3. Transformation (L1 -> L1):
   The deepest and rarest influence occurs when an individual transforms Collective L1 Vision (the fundamental Purpose or archetypal horizon of the supersystem).

In all these cases, the vertical paths inside the individual (from Execution up through Planning, Norms, and Purpose) and the vertical layers of the supersystem (from Infrastructure and Governance up through Culture and Archetypal Vision) are linked through membranes and feedback loops. The Fourfold Logic and World Soul arc make these dynamics explicit by tying them to polarity (upper/nether poles) and the V-shaped movement of descent and ascent.

19. Conclusion

The vertical and horizontal dimensions provide a powerful framework for understanding development within the Fourfold Logic and World Soul model. The vertical dimension captures consciousness evolution, spiritual ascent, and individual depth realization, while the horizontal dimension addresses social embeddedness, collective participation, and relational context. These dimensions intersect at each of the four layers (physical, emotional, mental, spiritual), with membranes mediating between external influences and internal integration.

This framework extends beyond Wilber's Integral Theory by incorporating explicit polarity (upper/nether poles), directionality (arc of descent and ascent), and dynamic transformation of substance and consciousness. The cyclical movement between solitary vertical development and collective

horizontal engagement ensures robust, resilient, and evolutionarily fruitful growth, culminating in individuation as wholeness—the harmonious alignment of all layers in the centered Self.

The membrane as mediator, reciprocal causality between individual and collective, and the necessity of balanced cyclic movement between vertical and horizontal dimensions reveal universal organizational principles applicable across biological, psychological, and spiritual domains. Nature demonstrates these principles through organism–environment interactions, developmental psychology reveals them in human maturation, and spiritual traditions encode them in practices of transformation and service.
